

# Elon Slayer Token Whitepaper

## Introduction

In a world of injustice the only way to make a change is to support righteous people and be one of them. This project is oriented in DEFI and Launchpad features and on investing its profits to support actions of our „Slayer” as well as funding startup projects focused on improving the world. Crypto world is a great place to offer both secure and transparent transactions and that’s what every funding needs, to let people trust in their goals and actions. Every initiative will be executed with the help of blockchain network which is very transparent in its architecture. Additional data will also be provided on products websites and applications allowing to verify the communities of recipients of the funds raised. A system created in this way allows the process to be monitored from start to finish by every active participant.

## Token

EST is going to be used for all types of transactions around the system. It’s a burnable token, which will be burned on specific events (f.e. achieved milestones, our „Slayer” or our app birthday etc.), after a successful community voting round in a blockchain contract.

## Our „Slayer” actions funding

Even when being the richest man in the world it’s nice to have additional support from other sources. Whilst connecting users by decentralized technologies, we focus on delivering our system features without downtimes, to let the source feed the river all the time.

## Projects funding

Every day new projects are deployed to blockchain networks. Most of them provide decent features, but many of them consume loads of energy just for fun purposes, not giving its user/holder any chance to grow as a human. On the other hand, there are some of them that may improve our lives. We focus on the potentiality to review any project in 24h by providing a blockchain contract for users to vote on.

## Fully open source and verified code

Every piece of our system that is designed to perform operations related to token trading or recording user decisions will be made public in the form of a repository available on github.com. This code will not only be available on an open-source basis, but each of its blockchain parts will be verified using a network explorer f.e for the BSC network (which is native to our token) it will be bscscan.com. This way the user will not only be assured of what we have written, but also that it has been made available for use in an unaltered form.

## **Vote system**

An important part of our system is the voting module. With the help of blockchain network everyone has an overview of how many votes were cast, how and by whom. There is no room for manipulation, which many governments in the history of the world have committed. This module is very important because it should be up to the people to decide how to distribute the funds in our system, to prevent breaking the promise of transparency and integrity in a growing team.
